

500 students. Seven days. ₹2,000.

Earn distribution through trusted campus groups, then make every referral measurable.

20

champions / 10 colleges

3

prioritised sources

₹4

maximum spend per registration at 500

01 / A specific student, a specific reason to join

Target: final-year BE/BTech students in 10 accessible engineering colleges, starting with CSE/IT/ECE and beginner AI learners. Focus on students who want a demonstrable project for interviews and have a laptop and internet. Other branches are welcome if the workshop suits their skill level. Recruit two class reps, coding-club leads or placement volunteers per college.

Why they care

"I have watched tutorials, but I still do not have a small AI project I can explain." Placement pressure, limited time and uncertainty about where to start are hypotheses to test in five short student conversations on day 1.

What earns registration

A 20-second project preview, free access, beginner prerequisites, a confirmed time, and a recommendation from a known classmate. Ask only name, email, college and final-year eligibility. Optional reminders; referrals never required.

02 / Three sources that can add up to 500

Priority / action	Assumed unique funnel	Registrations
1. Champion-led WhatsApp groups 20 champions; each posts to one admin-approved final-year group with a source-coded link. One follow-up after 48 hours.	20 × 150 reached = 3,000 30% click = 900 40% of clicks register	360
2. Clubs + placement cells 4 partners share through separate, eligible lists or email digests. Check overlap before including reach.	4 × 200 reached = 800 25% click = 200 40% of clicks register	80
3. Peer invitations After registration, offer a personal link to invite one relevant friend. No reward or sharing gate.	200 new prospects invited 60% click = 120 50% of clicks register	60
Total after deduplication, assuming distinct audiences		500

These rates are planning assumptions, not benchmarks or observed results. Peer invitations assume 200 of the 440 campus/club registrants invite one previously unreached prospect. Reconcile repeat emails and audience overlap; joining a group is not a registration. Email ownership must be verified in a live campaign.

03 / Why this has a chance

Known campus senders provide context and access within a week. A concrete build reduces ambiguity; a short form reduces friction. The strongest dependency is access: contact 30 potential champions to activate 20, and approach 8 partners to confirm 4. Neither acceptance rate is guaranteed.

04 / The seven-day operating plan

Day	What I would do	Cumulative goal
1	Confirm date, facilitator, project, tool access and prerequisites. Speak to 5 target students. Approach 30 champion candidates / 8 partners; test two messages with the first 2 groups.	20
2	Activate 20 champions and 4 distinct partner lists. Share a preview + tracked link. Review actual reach, unique clicks and form completion; choose the clearer message.	80
3	Complete first posts across the network. Help champions answer objections; enable optional peer links after registration.	170
4	Use source counts to support weak groups. If at least 40 below the 280 target, recruit 4 backup groups; at the base rate they could add 72 registrations.	280
5	Publish one approved follow-up per group with a real project preview and FAQ. Reallocate effort to proven sources; check overlap again.	380
6	Ask productive partners for one additional distinct eligible group if needed. Explain who the workshop suits. Share a truthful registration deadline.	450
7	Close at the announced deadline; export deduplicated records. Send joining details only to opted-in registrants. Report registrations, attendance and project starts separately.	500

05 / Spend only on delivery

20 fixed champion honoraria × ₹50	₹1,000
Phone / data reimbursements	₹300
Creative / preview production allowance	₹200
Contingency for delivery support	₹500
Total cap	₹2,000

Pay for approved delivery, not registrations. No paid ads, API or premium AI budget. Contingency can fund up to 10 extra ₹50 champion honoraria. Costs are hypothetical; no money has been spent.

06 / Watch the assumptions

Base: $360 + 80 + 60 = 500$.

Lower conversion: campus click 25% and registration 30% gives $225 + 80 + 60 = 365$. At 11.25 registrations per new 150-person group, 12 extra groups would be needed. The ₹500 reserve supports only 10 honoraria: improve conversion or add 2 volunteer groups; do not promise the target.

10% overlap: conservative haircut gives **450**. The tracker counts duplicate emails once; pre-registration overlap still reduces reach.

A/B pilot is directional, not statistically conclusive. Log delivered posts and unique tracked visits, then form completion. High reach + low clicks: revise hook. Good clicks + low completion: fix clarity or form.

07 / Built: Campus Relay, a working acquisition prototype

Source-coded champion links; a sample registration flow; unique-email checks with first-touch attribution; student referral links; a day-by-day dashboard; forecast sensitivity controls; and CSV export. Seeded with 160 clearly labelled fictional records. It supports the campaign's hardest operational question: **which source needs attention today?**

Browser-local simulation: no shared database, verified identities, click analytics or message delivery. Production would add those plus organizer authentication. The demo is not the registration system for a real workshop.

Message hypothesis: "Final-year engineers: want a small AI project you can explain? Build your first AI project in 60 minutes - free, online, beginner-friendly. See the preview, bring a laptop and register at [tracked link]. [Confirmed date / time]." Proposed project: an AI study helper; confirm with the facilitator before publishing.

Channel practice: use admin-approved group posts and voluntary reminder preferences. References: [WhatsApp marketing messages guidance](#); [Meta: business chat controls](#). Conversion rates are independent assumptions.
